

# AEC-Q200 QUALIFIED TYPE SMA-Q SERIES

# **INTRODUCTION**

TE Connectivity (TE) is pleased to introduce the new SMA-Q series, a metal film precision MELF resistor with SMD enabled structure, tight tolerance, and low TCR. A sister to our SMA-A series, the SMA-Q series is AEC-Q200 qualified and benefits from an improved coating which gives much better protection from humidity. It is lead free and RoHS compliant and comes in three sizes and six power ratings up to 1W.

#### **FEATURES**

- Thin film technology
- AEC-Q200 qualified
- Excellent overall stability
- Sn termination on the Ni barrier layer
- Tight tolerance down to ±0.1 %
- Extremely low TCR down to ±5 ppm/°C
- High power rating up to 1 Watts
- SMD enabled structure
- · Lead-Free and RoHS compliant
- Moisture sensitivity level MSL1

# **APPLICATIONS**

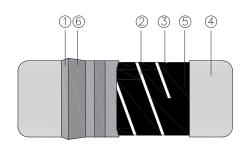

- Automotive
- Industrial
- Telecommunication
- Medical Equipment
- Measurement/Testing Equipment

AEC-Q200 Qualified Type SMA-Q Series

#### **PULSE WITHSTANDING CAPACITY**

The single impulse graph is the result of 50 impulses of rectangular shape applied. The limit of acceptance was a shift in resistance of less than 1% from the initial value. The power applied was subject to the restrictions of the maximum permissible impulse voltage graph shown.

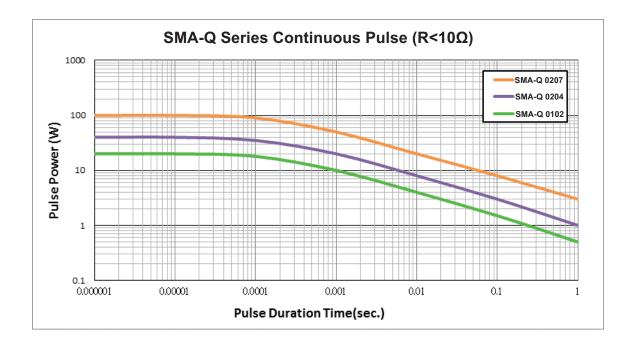

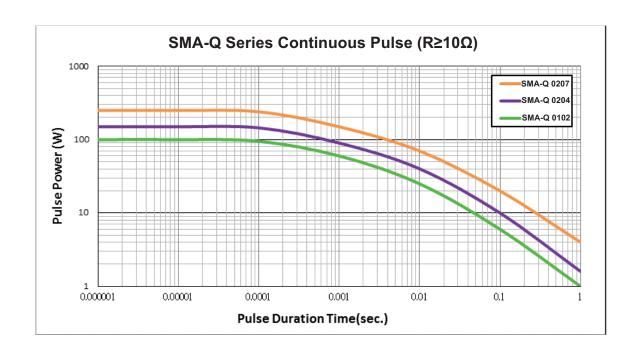

AEC-Q200 Qualified Type SMA-Q Series

#### **CONTINUOUS PULSE**

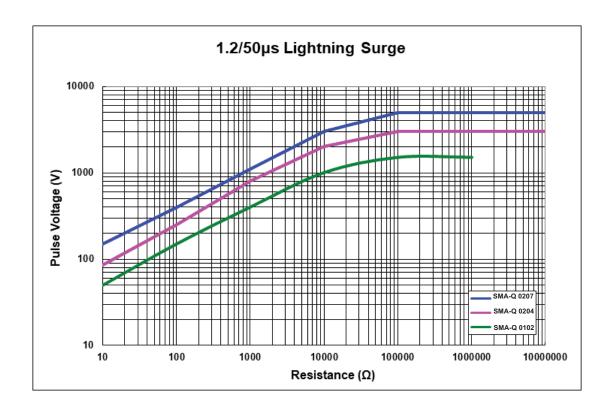

The continuous load graph was obtained by applying repetitive rectangular pulses where the pulse period was adjusted so that the average power dissipated in the resistor was equal to its rated power at 70°C. Again the limit of acceptance was a shift in resistance of less than 1% from the initial value.

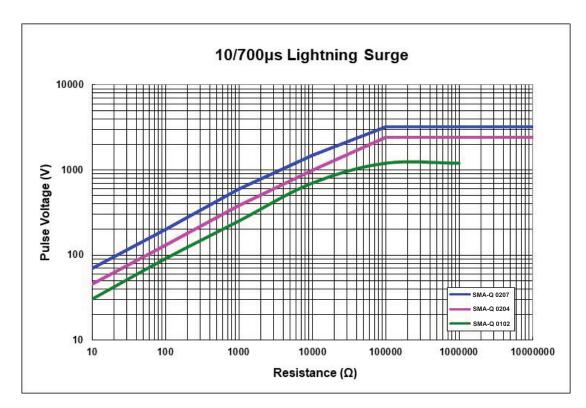

#### **LIGHTNING SURGE**

Resistors are tested in accordance with IEC 60115-1 using both 1.2/50us and 10/700us pulse shapes. The limit of acceptance is a shift in resistance of less than 0.5% from the initial value.

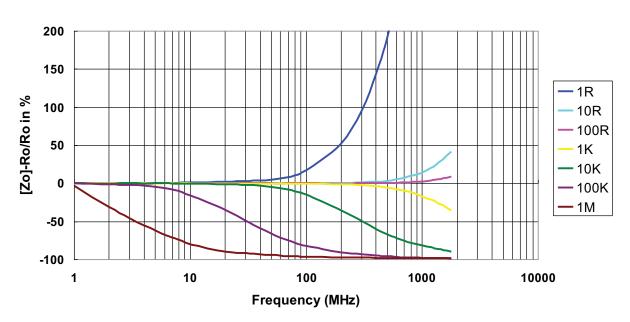

#### **FREQUENCY BEHAVIOUR**

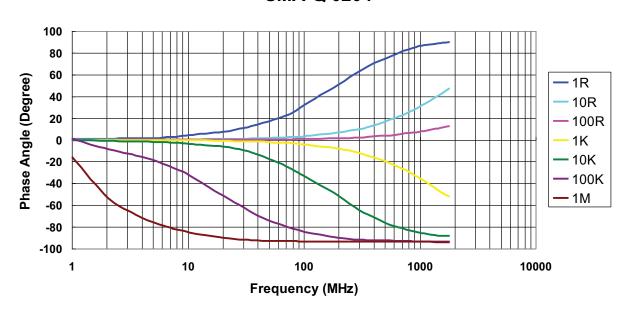

Resistors are designed to function according to ohmic laws. This is basically true of resistors for frequencies up to 100kHz. At higher frequencies, there is an additional contribution to the impedance by an ideal resistor switched in series with a coil and both switched parallel to a capacitor. The values of the capacitance and inductance are mainly determined by the dimensions of the terminations and the conductive path length.

The environment surrounding components has a large influence on the behaviour of the component on the printed-circuit board.
